

What our project will do:

Our project will take the scraped data from the website and give you the option to pick a genre. After you pick a genre, it will display the books, along with their prices, ratings, and other information. It will also display it from the best-rated book to the lowest-rated book.

Fields required:

- Title of genre
- Title of books within the genre
- Price of said books
- Star rating
- Books left in stock
- The UPC
- 1-sentence summary of said books

Definition of done:

1. The app will give you pick the genre and direct you to the books there
2. It will give you the books within the genre in order of star rating
3. It will then let you select the book you want, and will give you the price of the book and how many are left in stock
4. If you want further information on said book, you can get a 1-sentence summary and the UPC
5. It should then redirect you to the actual site to buy the book

Book Scraper User Manual

- Setup
 - Ensure Python is installed on your computer.
 - Install the necessary libraries using: `pip install requests beautifulsoup4`.
- Launching the Tool
 - Run the script via your terminal: `python your_script_name.py`.
 - The tool will automatically connect to the live site and fetch the latest genres.
- Selecting a Genre
 - Review the numbered list of categories.
 - Type the number of the genre you want to explore and hit Enter.
- Viewing the Books
 - The script will display a list of all books in that category.
 - Books are automatically sorted by rating (highest rated books appear at the top).
- Retrieving Book Details
 - Choose a specific book by typing its list number.
 - The script will print the UPC, Stock availability, and a Plot summary.
 - A URL is provided at the bottom if you want to view the book in your browser.
